CHAPTER ONE

Video Development -Old Iron

Video Overview

Wounded combat Metalware seeks emergency repairs from the mechanic Aran during a stormy night; following a cold, grueling reconstruction, he leaves behind a symbolic gifts come back into the wasteland.

How we did this?

1、download the comfyui and LTX2-Rapid-Merges workflow

I'm winding down maintaining these models. I recommend checking out the [merging script](#) to create your own, as at least the NSFW model is very outdated. Thank you for all of the support and feedback!

These are experimental FP8 merges of the LTX2 diffusion model. "All in ones" do not seem to be in the cards, as LTX2 has lots of (large) moving parts, including 2 VAEs for video and audio. So, for the meantime, I'm just going to focus on the diffusion model. For all other models needed to run LTX2, please refer here: https://huggingface.co/Kijai/LTXV2_comfy.

Workflow uploaded! It is messy as shit but does "everything" (I2V, First to Last Frame and T2V) very quickly and efficiently using all the tricks I've collected. I highly recommend using it and read the included note (particularly about required nodes). "Save output" is set to "false" on the VideoCombine, so switch that to "true" when you start making something you want to keep.

The text encoder can be found here (I recommend fp8-scaled): https://huggingface.co/Comfy-Org/ltx-2/tree/main/split_files/text_encoders

I can only recommend my workflow with the included settings, as there are so many pitfalls getting LTX to work properly. Old models have been removed because they were generated from a broken script. All models now should be "working" moving forward.

----- SFW VERSION HISTORY -----

V3: Distill LORA at 0.9 with the detailer LORA at 0.4. Good general purpose LTX2 model.

2、download the installation package and place the them in the corresponding library

Putting this two package into clip library

 gemma_3_12B_it_fp8_scaled.safetensors	 Safe		13.2 GB	 xet	
 ltx-2-19b-embeddings_connector_distill_bf16.safetensors	 Safe		2.86 GB	 xet	

Putting this two package into vae library

 LTX2_audio_vae_bf16.safetensors	 Safe		218 MB	 xet	
 LTX2_video_vae_bf16.safetensors	 Safe		2.45 GB	 xet	

Putting this package into diffusion_models

 ltx2-phr00tmerge-sfw-v5.safetensors	 Safe		18.9 GB	 xet	
---	--	---	---------	---	---

2、download the installation package and place the them in the corresponding library

And then the models set down already

3、 Write the script and complete the storyboard

Scene I: Shattered (00:00 - 00:20)

- **[Medium Shot]** The battlefield is thick with smoke. **Metalware**, draped in a tattered cloak, navigates through the flickering firelight.
- **[Close-up]** An enemy's vibration blade slashes down. Metalware raises his left arm to block. The metal casing shatters under the heavy impact, sending blue electric sparks flying toward the edge of his metallic mask.
- **[Medium Close-up]** He staggers back, the mechanical knuckles of his left hand twisted at an unnatural angle. He glances down at his mangled arm; his red optic sensors flicker (indicating unstable energy). He abruptly pulls his cloak tight to conceal the wound and vanishes into the thick fog.

Scene II: The Knock (00:20 - 00:35)

- **[Wide Shot]** Torrential rain pours down. Metalware stands before a rusted, hidden iron door. His silhouette appears exceptionally tall and solitary beneath his bamboo hat and long cape.
- **[Action Close-up]** Using his remaining right hand, he hammers heavily on the iron door. The dull, metallic thuds drown out the sound of the rain.
- **[Medium Shot]** The door slowly creaks open. **Aran** appears in the dim light and shadows. He pushes up his black-rimmed glasses, gazing at Metalware's battered frame.
- **[Action/Exchange]** Aran says nothing; he simply steps aside and gestures for the other to enter. As Metalware walks in, his shoulder clips the doorframe due to sheer exhaustion.

Scene III: Remolding (00:35 - 01:10)

- **[Long Shot]** The workshop interior, filled with Aran's repair tools and spare parts. Metalware sits silently on a steel chair.
- **[Action Close-up]** Aran roughly pulls back Metalware's cloak to inspect the left shoulder. Severed wires twitch like dying nerves.
- **[Extreme Close-up]** Laser welding. Aran's expression is cold and focused. With oil-stained fingers, he precisely pries open the metal chassis and embeds a faintly glowing drive core.
- **[Physical Expression]** The repair process is agonizingly intense. Metalware's right hand grips the armrest of the steel chair so hard the metal begins to deform under his strength, yet his masked face remains deathly still.
- **[Action/Exchange]** The welding ends. Aran pats Metalware's new shoulder and points toward a container of energy fluid on the workbench.

Scene IV: Lingering Warmth (01:10 - 01:30)

- **[Medium Shot]** Metalware stands up. He tentatively flexes his left hand; the fingers produce a smooth, mechanical clicking as they lock into place.
- **[Action Close-up]** He pulls a cloth bundle soaked in blood and oil from his vest and places it steadily on Aran's workbench.
- **[Medium Close-up]** Metalware stops at the doorway without looking back. He extends his newly repaired left hand, spreading his fingers to feel the cool morning air before clenching them into a fist—the knuckles snapping shut with a crisp mechanical lock. He tilts his head slightly; the red light on his mask flickers off and on (resembling a human blink). He then raises his right hand and tosses a specially made metal tag, still warm, back onto the workbench as a silent vow or marker.
- **[Wide Shot]** Morning sunlight pierces through the post-rain clouds, hitting Aran's silhouette from behind. He looks down to inspect the bundle, while Metalware's figure has already disappeared into the far reaches of the ruins.

4、Generate the video according to the prompt and the first and last frames

5、Complete the video editing on JianYing

CHAPTER TWO

Game Development -Old Iron

Game Overview

Old Iron is a top-down 2D game developed using Claude Code and Unity.

The entire game development process is carried out using the Unity engine via Claude Desktop, so even if you know nothing about game engines or development, you can still create games this way.

Key Tools

MCP FOR UNITY

MCP for Unity is a tool based on the Model Context Protocol that establishes a direct communication bridge between AI assistants and the Unity Editor. It enables the AI to have real-time "awareness" of the full project context, including code structures, asset directories, and component configurations, facilitating efficient AI-driven development.

CLAUDE DESKTOP

Claude Desktop's MCP is an open-standard connectivity framework that enables Claude to securely interact with local data sources, tools, and third-party services. By breaking the "context silo" of traditional LLMs, MCP allows Claude to move beyond chat-based interactions and function as an active participant in a local development environment.

Development Environment Setup

Set up the development environment using the MCP configuration documentation provided by Claude and the tutorials available in the “MCP for Unity” GitHub repository.

Creating Game Assets

We found some suitable characters in the Hugging Face repository and then used ComfyUI to process these images into suitable game assets.

Chat with Claude

All we need to do next is chat with Claude and have Claude complete the entire game according to your instructions.

THANK
YOU!
